Chapter 16 Thermal Energy and Heat

## Section 16.2 Heat and Thermodynamics

(pages 479-483)

This section discusses three kinds of thermal energy transfer and introduces the first, second, and third laws of thermodynamics.

## Reading Strategy (page 479)

**Building Vocabulary** As you read this section, add definitions and examples to complete the table. For more information on this Reading Strategy, see the **Reading and Study Skills** in the **Skills and Reference Handbook** at the end of your textbook.

Transfer of Thermal Energy				
Definitions	Examples			
Conduction: transfer of thermal energy with no net transfer of matter	Frying pan handle heats up			
Convection: transfer of thermal energy when particles of a fluid move from one place to another	Hot air circulating in an oven			
Radiation: transfer of energy by waves moving through space	Heating coil of a stove glows			

## Conduction (pages 479-480)

**1.** The transfer of thermal energy with no overall transfer of matter is

called <u>conduction</u>.

**2.** Is the following sentence true or false? Conduction is faster in metals than in other solids because metals have free electrons that transfer

thermal energy. \_\_\_\_\_true

- 3. Circle the letter of each sentence that is true about conduction.
  - (a.) Thermal energy is transferred without transfer of matter.
  - b. Conduction can occur between materials that are not touching.
  - (c.) In most solids, conduction takes place as particles vibrate in place.
- **4.** Complete the table about conduction.

Conduction					
Type of Material  Quality of Conduction		Two Examples			
Thermal conductor	Conducts thermal energy well	Copper; aluminum			
Thermal insulator	Conducts thermal energy poorly	Wood; air
